City Background

The City of Brentwood (City) lies in Eastern Contra Costa County and is bounded to the north by the City of Oakley, to the west by the City of Antioch, and to the south and east by unincorporated portions of Contra Costa County. The City was incorporated in 1948. Its incorporated boundary currently totals 14.8 square miles (9,502 acres), with a sphere of influence totaling 17.4 square miles (11,129 acres) (City of Brentwood, 2021a). The City provides water treatment and distribution services as well as wastewater collection and treatment services for its residents and businesses. The City's water distribution system consists of three pressure zones, one potable water treatment plant (WTP), nine groundwater wells (five of which are active), six water reservoirs, seven water booster pump stations, and 347 miles of water mains within the city limits (City of Brentwood, 2013a). The City also has one wastewater treatment plant (WWTP). Figure 1-1 shows the service area and its surroundings.

1.1 Water Supply

The City's water supply consists of surface water from the Sacramento-San Joaquin Delta (Delta), groundwater from the East Contra Costa Subbasin (ECC Subbasin), and recycled water. The reliability of the City's surface water supplies is relatively high since the permanent purchase entitlement from which the City's supplies stem are protected by pre-1914 water rights, which historically have not been subject to delivery reductions during water shortages, including regulatory restricted and drought years. The City's groundwater supply appears to be reliable as available data for the ECC Subbasin indicate that historical extraction patterns have not exceeded the safe yield of the basin (City of Brentwood, 2021b). The comparison of current and projected water supply and demand conducted as part of the water supply reliability assessment in the 2020 Urban Water Management Plan (UWMP) showed that the City water supply is adequate to meet the projected demand across all year types.

1.2 Water Supply Reliability

Even though the reliability of the City's water supply is relatively high, there are issues that could result in the City declaring a water shortage stage condition. Below is a list of key issues that could result in a shortage condition for the City:

- State mandates due to drought circumstances.
- Availability of Delta water supplies:
 - Climate change-related sea-level rise and extreme weather
 - Water quality conditions/contamination
 - Mechanical breakdown of surface water diversion structure, intake, or WTP facilities
- Declining groundwater levels.
- Groundwater Sustainability Plan (GSP) groundwater pumping limitations (this is a future potential condition - to be defined by the East Contra Costa Subbasin Groundwater Sustainability Agencies).
- Contamination of one or more wells.

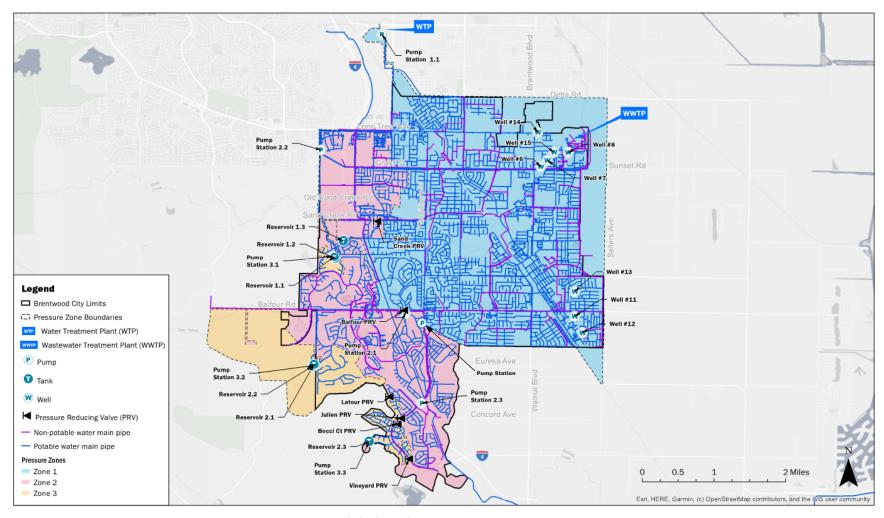

Figure 1-1. City of Brentwood water service area

Annual Water Supply and Demand Procedures

In 2018, the California Legislature enacted into law new requirements for urban water suppliers to increase drought resilience and to improve communication of water shortage response actions. Among other activities, this legislation required each urban water supplier to prepare an Annual Water Supply and Demand Assessment (Annual Assessment) and submit an Annual Water Shortage Assessment Report to the California Department of Water Resources (DWR) on or before July 1, 2022, and every year thereafter. The Annual Assessment Report is submitted to DWR with information for anticipated shortage, triggered shortage response actions, compliance and enforcement actions, and communication actions consistent with each suppliers Water Shortage Contingency Plan (WSCP).

The City's Annual Assessment determination is based on considerations of unconstrained water demand, available water supplies, and infrastructure capabilities. Since shortages are based on the difference between expected water supplies and unconstrained demand under current year and subsequent dry year conditions (i.e., July 1, 2024 to June 30, 2025, referred to as Current Year hereinafter), the locally applicable evaluation criteria used in the Annual Assessment for determining a shortage includes the following:

- Depiction of Current Year based on best-available data, including anticipated hydrologic conditions.
- Current Year unconstrained demand for the City's customers considering weather, growth, and other influencing factors.
- Estimation of available water supply for Current Year.

What follows is an overview of the City's Annual Assessment procedures and a summary of the key data inputs that went into the analysis.

2.1 Decision Making Process

The City's Annual Assessment follows the steps that are outlined in the City's 2020 UWMP and that are illustrated in Figure 2-1. These steps are described below. The procedures will continue to be reviewed and updated as necessary.

Step 1. Estimate Unconstrained Customer Demand - Current Year unconstrained demand considering weather, growth, and other influencing factors such as policies to manage current supplies to meet demand objectives in future years, as applicable is estimated. Unconstrained customer demand does not include demand reductions that may occur as a result of the City implementing any special shortage response actions that may be necessary.

Step 2. Estimate Available Water Supply - The available water supply by source is estimated for the Current Year:

Quantify each source of water supply and provide descriptive text of each source.

- Quantify Current Year available supply by source, this includes coordinating with East Contra Costa Irrigation District (ECCID) and Contra Costa Water District (CCWD) and considerations for hydrological and regulatory conditions.
- Considerations for water supply availability estimates by source:
 - The existing infrastructure capabilities and plausible constraints as they impact the City's ability to deliver supplies to meet expected customer water use needs in the coming year should be considered
 - Specific locally applicable factors that can influence or disrupt each supply source

Step 3. Compare Projected Water Supplies to Demands – The estimated water supplies identified in the Annual Assessment represent the maximum water demand that can be met after factoring in the considerations noted in Step 2.

Step 4. Identify and Quantify Anticipated Water Supply Shortages, if any – The estimated water supplies in comparison to unconstrained water demands identified and quantified any anticipated water shortages. Depending on the extent of the projected shortage, the appropriate shortage stage would be selected at this stage.

Step 5. Develop Draft Annual Assessment Report – The City compiles the draft Annual Assessment report based on the format determined by DWR using the key data inputs and evaluation criteria.

Step 6. Review Draft Annual Assessment Report – The City reviews and provides comment on the draft Annual Assessment report.

Step 7. Address Comments to the Draft Annual Assessment Report, Finalize Report – The City addressed internal comments to the draft Annual Assessment report and finalizes the report.

Step 8. Submit Annual Assessment Report to DWR – The City submits the Annual Assessment report to DWR.

Figure 2-1. Annual Assessment Procedure and Decision-Making Process

Annual Water Supply and Demand Analysis

The following sections describe the approach that was utilized to estimate unconstrained water demand, available water supply, the supply and demand analysis, and any planned shortage response actions. For this Annual Assessment, the Current Year is defined as the twelve-month period which ends on June 30th, preceding the July 1st due date of the Annual Assessment Report. Other pertinent information on the City's Annual Assessment is included in Table 3-1.

3.1 Current Year Unconstrained Water Demands

The City's water system serves more than 21,000 connections. Historical water deliveries for the following water sectors were obtained from the City's annual reports:

Single-Family Residential – This sector refers to single-family residences in an identifiable suburban residential neighborhood or cluster-style development designed with open space and other amenities.

Multi-Family Residential – This sector refers to families living in apartments and condominiums in structures of two or three stories with off-street parking and other requirements for higher density living.

Commercial/Institutional/Industrial – This sector includes commercial, government, and industrial uses. It primarily includes uses associated with commercial buildings (e.g., landscaping; toilets; heating, ventilation, air conditioning, etc.) and commercial uses (e.g., car washes, laundries, nurseries, etc.).

Landscape – This sector primarily includes raw water (untreated) use for irrigation at parks, schools, cemeteries, churches, residences, or public facilities. This sector also includes recycled water at various parkways and landscaped medians throughout the City.

Other – This sector includes metered water used for construction and unmetered water used for fire response from fire hydrants throughout the City. Hydrant meters are read quarterly.

Water demand projections were estimated using an assumed gallons per capita day (GPCD) of 152 and population projections. This GPCD was estimated based on the water use between 2018 and 2020. This approach takes into account steady stabilization of post-drought water use levels of 2018 and 2019 with increased levels of residential water use in 2020 due to the COVID 19 pandemic. The year 2020 water use was included in the assumption since it is expected that remote work and social habits will persist in the following years, causing water use trends from 2020 to affect future years instead of acting as an isolated event. Observed water use in 2021 and 2022 support this assumption. This approach is consistent with the approach that was utilized in the City's 2020 UWMP and 2022 Annual Assessment. Table 3-2 presents the projected water demands used in this Annual Assessment.

Units: million gallons (MG)

3.2 Current Year Available Supply

The City's current supply consists of both surface water from the Delta, groundwater from existing wells located in the ECC Subbasin, and recycled water. These supply sources are briefly described below including the assumptions that were used to estimate the amount of available supply for the Current Year.

3.2.1 Groundwater

The City pumps groundwater from the ECC Subbasin, an alluvial basin underlying the City. The City has nine permitted groundwater wells within its service area, five of which are active wells. The total design capacity of the wells is 6.05 million gallons per day (MGD). The reliable capacity of the wells, where reliable well capacity is the capacity of all the wells minus the capacity of the largest well, is

^{--:} not applicable

a. Projections are based on best available data at time of submitting the report and actual demand volumes could be different due to many factors.

4.61 MGD. However, due to several factors including water quality concerns, the City anticipates only being able to pump 2.5 MGD, which equates to about 913 million gallons (MG) for the year.

3.2.2 Surface Water Supplies

The City's surface water supply stems from an agreement with ECCID that provides the City with a permanent entitlement to purchase 14,800 acre-feet per year (AFY) (4,823 MG per year [MGY]) of surplus irrigation water from the Delta. ECCID has pre-1914 water rights, which historically have not been subject to delivery reductions during water shortages, including regulatory restricted and drought years. The City anticipates being able to tap into the entire 4,823 MGY purchase entitlement for the Current Year even though historically the need to do so has not been there.

The City's surface water supply is transported through the Contra Costa Canal where a portion of the water is treated at the CCWD Randall-Bold Water Treatment Plant (RBWTP) and the rest is either treated at the City of Brentwood Water Treatment Plant (COBWTP) or can be used as raw surface water for non-potable landscape irrigation. The RBWTP has a design capacity to treat up to 50 MGD and is jointly owned by Diablo Water District and CCWD. The City has purchased a permanent capacity share of 6 MGD at the RBWTP and may use additional capacity on an as-need basis (CCWD, 2020). CCWD informed the City that no restrictions would be imposed on this allotment for this next fiscal year (FY) (see Appendix A for the letter that was provided by CCWD). However, based on expected development and current demands within the CCWD overlap area, the City anticipates only utilizing 1,902 AF (620 MG) for this Current Year.

The COBWTP was built in 2008 and can treat up to 16.5 MGD (6,023 MGY) of surface water. The COBWTP is designed so that it can be expanded to an ultimate capacity of 33 MGD (12,045 MGY) to serve a portion of the City's projected water demands through 2045. For this assessment, it is assumed that 3,891 MGY of water would be made available through the COBWTP and that approximately 913 MGY would be made available as raw surface water for non-potable landscape irrigation.

3.2.3 Recycled Water

Recycled water is an important part of the City's water resources. Recycled water allows the City to conserve potable water, thereby ensuring a reliable water supply for current and future demand. The City has developed preliminary planning documents to identify uses for recycled wastewater at both existing and future sites. Recycled water demands are estimated to be 2,111 AF (688 MGY) at buildout (City of Brentwood, 2013b). However, expansion of the recycled water system to meet the demand for some of these customers will likely come at a high cost per acre foot of demand added (City of Brentwood, 2013b). A buildout demand totaling 1,560 AF (508 MGY) is deemed more feasible (City of Brentwood, 2013b). It is anticipated that up to 913 MG recycled water could be available for the Current Year.

3.2.4 Constraints on Surface Water Resources

The City's surface water supply is from the San Joaquin River Delta. Due to weather variations, storm events, and diurnal patterns, water quality for each of the three sources of surface water (Old River, Middle River, and Rock Slough) in the Contra Costa Canal can fluctuate from year to year, seasonally, daily, and even hourly. Raw water from the Delta is characterized by low to moderate levels of turbidity, minerals, and natural organic matter. Pathogenic organisms tend to be present in low concentrations as well (City of Brentwood, 2016). Water from the Contra Costa Canal is routinely monitored for pesticides and other contaminants (e.g., synthetic organic compounds, nitrate, radionuclides, perchlorate, arsenic). These constituents are typically not detected (City of Brentwood,

2019). The COBWTP and RBWTP are amply equipped to handle the fluctuations in raw water quality and consistently produce a high-quality treated water.

3.2.5 Constraints on Groundwater Sources

While DWR has not designated the ECC Subbasin in overdraft and current groundwater levels and raw water delivery rates are assumed to be constant for the 2020 UWMP, the City is aware that future conditions may vary. Environmental factors, such as drought conditions, and water quality factors, such as groundwater contamination, have the potential to affect this resource adversely. The City is prepared to manage any changes that may occur due to extended drought or potential effects of climate change adaptively via conservation measures and an increased use of recycled water.

3.2.6 Summary of Available Water Supply

Table 3-3 presents the water supplies anticipated to be available for the Current Year.

					Tal	ole 3-3	. (DWR	R Table	3) Wa	ter Sup	plies					
			Start Year: 2024 Volumetric Unit Used: million gallons													
	Additional		Projected Water Supplies - Volume													Total Right

Total by Month (Non- Potable)		143	138	119	86	48	14	11	18	31	57	117	131	913		

Notes:

Values in green cells are auto calculated using water supply data.

Units: million gallons (MG)

RBWTP Supply: The City has a permanent treatment capacity share of 6 mgd. The 6 mgd that is treated at RBWTP comes from the total ECCID purchase entitlement of 4,823 MGY. However, based on expected development and current demands within the CCWD overlap area, the City anticipates only utilizing 1,902 AF (620 MG) this upcoming FY.

Recycled Water: It is assumed that 50% of the WWTP capacity is available for future recycled water use.

^{--:} not applicable

a. Projections are based on best available data at time of submitting the report and actual supply volumes could be different due to many factors. Groundwater (ECC Subbasin 5-22.19): The firm design capacity of the City's wells is 4.61 mgd. However, due to several factors including water quality concerns, the City anticipates only being able to pump 2.5 MGD, which equates to about 913 million gallons (MG) for the year.

City Water Entitlement: The total ECCID purchase entitlement is that of 4,823 MGY (14,800 AFY). A portion of this water is treated at RBWTP and the rest of the total was directed to potable supplies based on an average of actual 2018 to 2020 water use. None of this water was directed to non-potable supplies.

3.3 Water Supply and Demand Comparison

The water supply and demand comparison for Current Year potable and non-potable water is presented in the Tables 3-4a and 3-4b, respectively. Water supply for potable water use is sufficient every month for the time period covered by this Annual Assessment. Note that no shortage condition has been triggered and no shortage response actions are anticipated during the assessment period.

		Tal	ole 3-4a.	(DWR Ta	ble 4P) F	otable V	/ater Sho	rtage As	sessmen	ta

Notes:

Values in orange cells were pulled from Tables 3-2 and 3-3.

Values in green cells are auto calculated using water supply and demand data.

Units: million gallons (MG)

As shown in Table 3-4b, the City's non-potable water supply is anticipated to be adequate to meet the projected non-potable demand. No shortage response actions are expected to be needed for the Current Year, much like what was observed for the potable water use assessment.

^{--:} not applicable

a. Assessments are based on best available data at time of submitting the report and actual volumes could be different due to many factors.

Notes:

Values in orange cells were pulled from Tables 3-2 and 3-3.

Values in green cells are auto calculated using water supply and demand data.

Units: million gallons (MG)

It is important to note that the "Anticipated Total Water Supply" and "Anticipated Total Non-Potable Supply" totals shown in Table 3-4a and 3-4b, respectively, follow patterns established by historical production data to meet monthly water demands. The City has the ability and water supplies available to adjust the amount of water produced in any given month to meet potential demand variations. Note that these adjustments are subject to capacity limitations, like well and WTP capacity.

^{--:} not applicable

a. Assessments are based on best available data at time of submitting the report and actual volumes could be different due to many factors.

Planned Shortage Response Actions

Based on the results of the supply and demand analysis, no supply shortage is projected through June 2025. No water shortage response actions are planned (see Table 4-1). However, the City will continue to monitor water supplies and demands to reassess shortage conditions and adjust response actions, if needed.

Table 4-1. (DWR Table 5) Planned Water Shortage Response Actions											
July 1, 2024 to June 30, 2025											
		Is action		on going to reduce tage gap?	When is the shortage response action anticipated to be implemented?						
Anticipated Shortage Level	Actions: Demand Reduction, Supply Augmentation, and other Actions	already being implemented	Enter Amount	Select % or Volume Unit	Start Month	End Month					
0 (No Shortage)	No Actions		0	%							

Notes:

While the water supply and demand assessment does not forecast a water supply shortage, since 2016 the City permanently adopted several water efficiency best practices that support water conservation. The City maintains an ongoing public information campaign consisting of distribution of literature, speaking engagements, bill inserts, and conversation messages printed in local newspapers and on the City's internet web page. The City also provides as needed updates to the public and governmental bodies to explain potential drought situations including drought stages and mitigating actions. Educational programs in area schools are ongoing.

Subject: CCWD 2024 Annual Water Supply and Demand Assessment – Supply Allocations

Dear Casey Wichert:

The Contra Costa Water District (CCWD) is currently preparing the 2024 Annual Water Supply and Demand Assessment (AWSDA) in conformance with California Water Code Division 5, Part 2.6, Section 10632. This is a requirement for all urban water agencies in the State to submit to the Department of Water Resources no later than July 1, 2024.

CCWD's Central Valley Project (CVP) water supply allocations for the 2023 and 2024 contract years are 100 percent. CCWD projects sufficient supplies are available to meet demands for the current year as well as one subsequent dry year, assuming unconstrained demands, based on CCWD's CVP allocations and assessment of CCWD water supply and demands. Therefore, municipal customers are not requested to reduce water use as supplies are anticipated to be sufficient to meet demands for the period covered under this AWSDA.

If you would like to discuss this or have any questions or concerns, please contact me at (925) 688-8216 or Jill Mosley at (925) 688-8127 or mosley@ccwater.com. CCWD looks forward to continuing to work with you as we complete the 2024 AWSDA.

Sincerely,

Kimberly Lin

Director of Planning
